# 1. IE Basics

# The Question

- How good is your design
  - for satisfying your requirements?

# Primitive Basis a traditional design assertion

- " 'Design X
- " will be the right one
- " for our security requirements'

# The Problems of understanding a design

## • 1. No clear definition of 'Security'

- how much? (95% or 99.99%?)

- what types? (detect, prevent, thwart, fix)

- which attacks (insider, hacker, terrorist)

- when? (next week, next year)

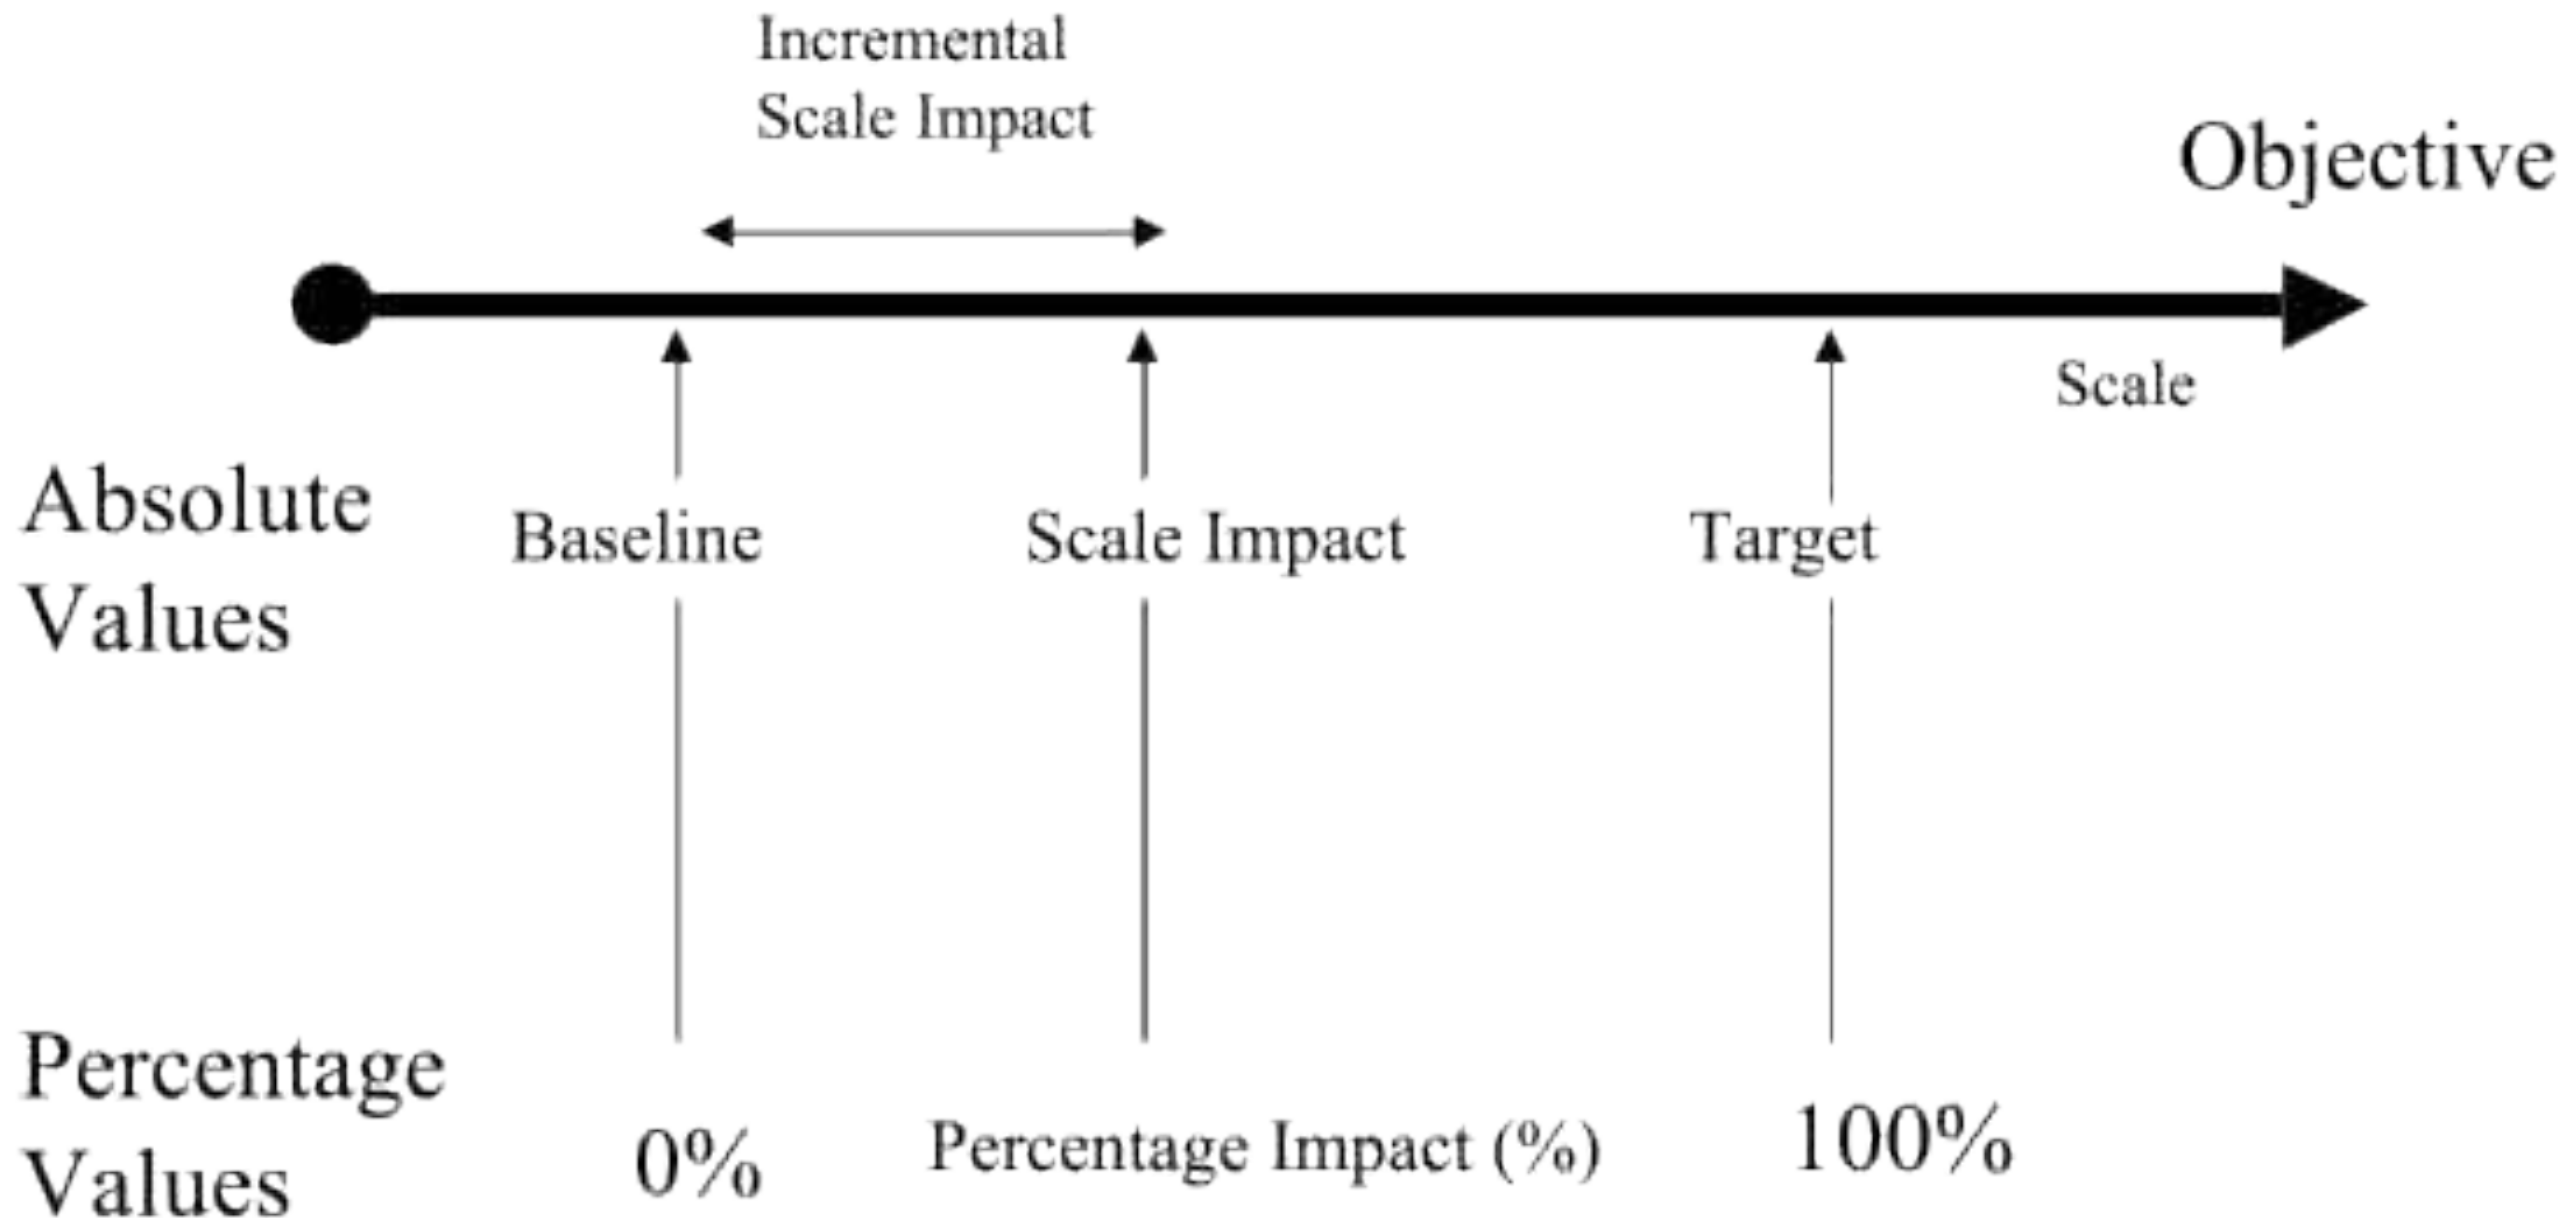

## • 2. No clear definition of the design

- detail, history, costs, guarantees, side effects, risks, dependencies, issues

- value ?

# Credibility Table

<i>Credibility Rating</i>	<i>Meaning</i>
0.0	Wild guess, no credibility
0.1	We know it has been done somewhere
0.2	We have one measurement somewhere
0.3	There are several measurements in the estimated range
0.4	The several measurements are relevant to our case
0.5	The method used to obtain the several relevant measurements is considered reliable
0.6	We have used the method/design/idea/strategy in-house
0.7	We have reliable measurements for the design idea in-house
0.8	Reliable in-house measurements correlate to independent external measurements
0.9	We have used the idea on this project and measured it (Evo step, pilot and field trial)
1.0	Perfect credibility, we have rock solid, contract-guaranteed, long-term and credible experience with this idea on this project and,

# Impact Estimation Analyzes Requirement |-| Design relationships across systems if necessary.

  - "Credibility rating
  - "Safety factors
- "IE Forces better definition specification
  - "Requirements
  - "Designs
  - "evidence

- "Acceptable Risk levels can be managed:
  - "By Setting safety factor limits in Rules for specification
    - ‘At least 200%’ sum for all designs’
      - "“defect” IE Table if not met (>200%)
  - "By setting exit/entry levels for Credibility averages
    - ‘At least 0.5 average’
      - "Unacceptable/not completed if we fail to meet these levels

# What uses can we put impact estimation to?

1. Evaluating a single design idea. How good is the idea for us?
2. Comparing two or more design ideas to find a winner, or set of winners. Use IE, if you want to set up an argument against a prevailing popular, but weak design idea!
3. Gaining an architectural overview of the impact of all the design ideas on all the objectives and budgets. Are there any negative side effects? What is the cumulative effect?
4. Obtaining systems engineering views of specific components, or specific performance aspects.  
Are we going to achieve the reliability levels?
5. Analyzing risk: evaluating a design with regard to 'worst case' uncertainty and minimum credibility.
6. Planning evolutionary project delivery steps with regard to value and cost.
7. Monitoring, for project management accounting purposes, the progress of individual evolutionary project delivery steps and, the progress to date compared against the requirement specification or management objectives.
8. Predicting future costs, project timescales and performance levels.
9. Understanding organizational responsibility in terms of performance and budgets by organizational function.  
In 1992, Steve Poppe pioneered this use at executive level while at British Telecom, North America.
10. Achieving rigorous quality control of a design specification prior to management reviews and approval.
11. Presenting ideas to committees, management boards, senior managers, review boards and customers for approval.
12. Identifying which parts of the design are the weakest (risk analysis). If there are no obvious alternative design ideas, any 'weak links' should be tried out earliest, in case they do not work well (risk management). This impacts scheduling.
13. Enabling configuration management of design, design changes, and change consequences.
14. Permitting delegation of decision-making to teams. Teams can achieve better internal progress control using IE, than they can from repeatedly making progress reports to others, and acting on others' feedback.
15. Presenting overviews of very large, complex projects and systems by using hierarchical IE tables. Aim for a one page top-level IE view for senior management.
16. Enabling cross-organizational co-operation by presenting overviews of how the design ideas of different projects contribute towards corporate objectives. Any common and conflicting design ideas can be identified. This is important from a customer viewpoint; different projects might well be delivering to the same customer interface.
17. Controlling the design process. You can see what you need, and see if your idea has it by using an IE table. For example, which design idea contributes best to achieving usability? Which one costs too much?
18. Strengthening design. You can see where your design ideas are failing to impact sufficiently on the objectives; and this can provoke thought to discover new design ideas or modify existing ones.
19. Helping informal reasoning and discussion of ideas by providing a framework model in our minds of how the design is connected to the requirements.
20. Strengthening the specified requirements. Sometimes, you can identify a design idea, that has a great deal of popular support, but doesn't appear to impact your requirements. You should investigate the likely impacts of the design idea with a view to identifying additional stakeholder requirements. This may provide the underlying reason for the popular support. You might also identify additional types of stakeholders.

### 3. Related Disciplines: Requirements & Design

- Requirements Specification: quantified and “well defined”
- Design Specification: Estimated, and well-defined.

# Unclear Objectives

© UFS, Inc.

# Critical Project Objectives 'not clear'

# Critical Project Objectives 'not clear'

- A sample of about 6 projects, showed that **none of them had clear** quantified project top level critical requirements, yet
- The CTO commissioned us to look at his own selected sample of large troubled projects, wrt their requirements (2 days)
- The sample showed that they did **not** have clear quantified top level requirements
  - But that their team was **unable to write quantified requirements, say coached.**

# Critical Project Objectives 'not clear'

- The CTO concluded that **none of their 100s of projects had clear enough objectives, or primary improvement requirements, at their base**

# Critical Project Objectives 'not

The CTO asked Tom, clear'

**“This is so simple and obvious!  
Why don't we do it?”**

Tom replied:

“Universities don't teach it.

You don't teach it in house

You as CTO have not required it to be done

before giving funding

# Critical Project Objectives 'not clear'

# 20 Sept, 2011 Report on Gilb Evo method (Richard Smith, Citigroup)

- <http://rshotechnology.co.uk/blog/3>
- Back in 2004, I was employed by a large investment bank in their FX e-commerce IT department as a business analyst.
- The wider IT organisation used a complex waterfall-based project methodology that required use of an intranet application to manage and report progress.
- However, it's main failings were that it almost totally missed the ability to track delivery of actual value improvements to a project's stakeholders, and the ability to react to changes in requirements and priority for the project's duration.
- The toolset generated lots of charts and stats that provided the illusion of risk control, but actually provided very little help to the analysts, developers and testers actually doing the work at the coal face.
- The proof is in the pudding;
- I have used Evo (albeit in disguise sometimes) on two large, high-risk projects in front-office investment banking businesses, and several smaller tasks.
- On the largest critical project, the original business functions & performance objective requirements document, which included no design, essentially remained unchanged over the 14 months the project took to deliver,
- but the detailed designs (of the GUI, business logic, performance characteristics) changed many many times, guided by lessons learnt and feedback gained by delivering a succession of early deliveries to real users.
- In the end, the new system responsible for 10s of USD billions of notional risk, successfully went live over one weekend for 800 users worldwide, and was seen as a big success by the sponsoring stakeholders.

Richard Smith

ed a 3-day course with you and Kai whilst at Citigroup  
10 October © Gilb.com 61

Previous PM Methods:  
No 'Value delivery tracking'.  
No change reaction ability

Richard Smith

- "However, (our old project management methodology) main failings were that
  - it almost totally missed the ability to track delivery of actual *value* improvements to a project's stakeholders,
  - and the ability to react to changes
    - in requirements and
    - priority
    - for the project's duration"

We only had the illusion of control.  
But little help to testers and  
analysts

Richard Sm

- "The (old) toolset generated lots of charts and stats
- that provided the illusion of risk control.
- But actually provided very little help to the analysts, developers and testers actually doing the work at the coal face."

The proof is in the pudding;

Richard Smith

- "The proof is in the pudding;
- I have used Evo
  - *(albeit in disguise sometimes)*
  - on two large, high-risk projects in front-office investment banking businesses,
  - and several smaller tasks. "

*Experience:* if top level requirements are *separated* from design, the 'requirements' are **stable!**

Richard Smith

- "On the largest critical project,
- the original *business functions & performance objective* requirements document,
- *which included no design,*
- essentially remained *unchanged*
- over the **14 months** the project took to deliver,...."

# Dynamic (Agile, Evo) design testing:

not unlike 'Lean Startup'

Richard Smith

- " ... but the detailed **designs**
  - (of the GUI, business logic, performance characteristics)
- **changed** many many times,
- guided by lessons learnt
- and **feedback** gained by
- delivering a succession of early deliveries
- to real users"

It looks like the stakeholders liked  
the top level system qualities,  
on first try

Richard Smith

- " "In the end, the new system responsible for 10s of USD  
billions of notional risk,
- **successfully went live**
- **over one weekend**
- **for 800 users worldwide,**
- **and was seen as a big success**
- **by the sponsoring stakeholders."**

## THE LEARNING PROCESS

### THEORY, PRACTICE, DISCUSS, DOCUMENTATIONS

#### 1. Lectures (50%)

Basic Theory (Principles, Standards, Rules, Templates)  
Case studies (as far as possible from DB and banking)  
Examples of practice (as far as possible from DB and banking)

#### 2. Questions and discussion

3. Participant exercises  
(small groups 2 to 4), followed up by Instructors, and experienced DB assistants (if available)

4. Substantial digital documentation, a library of books, papers, cases

Requirements Course Outline <http://www.gilb.com/dl52>

#### Day 1

### Quantify Requirements

1. Overview: Exp 8  
Prerequisite in relation to Agile

#### Day 2

### Standards, Principles, Risks

1. Tips for analyzing project  
plans to find the real value

#### Day 3

### Design, Delivery, Culture Change

1. estimating the quantified  
impact of a design on

# Bank Business Analyst Training

## Requirements Workshop

### WORKSHOP ADVANTAGES

a complete method for tackling all the critical and real stakeholder requirements for a project, at all levels of consideration for IT Projects.

#### **BAR NONE**

the most advanced and comprehensive workshop on requirements specification in the world.

Master how you communicate your organisation's 'real' requirements, and your stakeholders' most critical improvement requirements, in an unambiguous, clear, measurable, and testable way.

### Project and System Level Requirements Specifications

#### Workshop Objectives:

This workshop will allow you to walk away with practical ability to improve your projects most critical requirements.

You will be able to identify, classify and specify critical project and stakeholder

#### Workshop Intended for:

People who write requirements (BAs), and their managers.  
Product owners, project managers and their managers  
Consultants, engineering/IT methods owners and teachers.

Workshop

## Day 1

### Quantify Requirements

1. **Overview:** Evo & Language in relation to Agile Methods
2. practical **examples** of Language for requirements (case studies)
3. the various requirements **concepts** defined deeply and exemplified
4. requirements **templates** (to make standards practical) design constraint templates (a type of required design or architecture)
5. how to **quantify** any qualitative requirement (like intuitiveness or adaptability or security) – this is the key ability that most all other 'requirements' workshops do not teach!
6. **advanced** scale of measure specification methods (a 'scale' is more than units)

## Day 2

### Standards, Principles, Risks

1. Tips for **analyzing** project plans to find the 'real' value requirements.
2. **standards** for requirements (rules, processes, templates, glossary)
3. **principles** for requirements (help you to tackle new problems better)
4. **quality control** of requirements: measuring requirement conformance to standards (reviews, inspections, agile reviews)
5. how to give information that determines **priorities** of requirements (example Wish/Goal/Fail and Qualifiers)
6. how to include requirement information about **risks and uncertainties**

## Day 3

### Design, Delivery, Culture Change

1. **estimating** the quantified impact of a **design** on requirements
2. evolutionary project management and how it integrates with requirements. The Evo cycle and how it relates to Agile iteration.
3. **training** requirements writers: how to train colleagues and yourself
4. changing requirements **culture**: how to change your culture of requirements
5. expected **results** from requirements culture improvement: how to measure or know that things are working well
6. a **policy** for improved requirements: summary of main guidelines for value driven projects, and value requirements.

# ONE PAGE PROJECT REQUIREMENTS QUANTIFIED

# Real Bank Project : Project Progress Testability

## Quantification of the most-critical project objectives on day 1

P&L-  
signed

### ONE PAGE PROJECT REQUIREMENTS QUANTIFIED

**Speed-To-Deliver: Scale:** average Calendar days needed from New Idea Approved until Idea Operational, for given Tasks, on given Markets.

**Past** [2009, Market = EURex, Task =Bond Execution] **2-3 months ?**

**Goal** [Deadline =End 20xz, Market = EURex, Task =Bond Execution] **5 days**

**Operational-Control: Scale:** % of trades per day, where the calculated economic differences between OUR CO and Marketplace/Clients, is less than "1 Yen"(or equivalent).

**Past** [April 20xx] **10%** change this to 90% NH **Goal** [Dec. 20xy] **100%**

**Operational-Control.Consistent: Scale:** % of defined [Trades] failing full STP across the transaction cycle. **Past** [April 20xx, Trades=Voice Trades] **95%**

**Past** [April 20xx, Trades=eTrades] **93%**

**Goal** [April 20xz, Trades=Voice Trades] **<95 ± 2%>**

**Goal** [April 20xz, Trades=eTrades] **98.5 ± 0.5 %**

**Operational-Control.Timely.End&OvernightP&L Scale:** number of times, per quarter, the P&L information is not delivered timely to the defined [Batch-Run].

**Past** [April 20xx, Batch-Run=Overnight] **1** **Goal** [Dec. 20xy, Batch-Run=Overnight] **<0.5>**

**Past** [April 20xx, Batch-Run= T+1] **1** **Goal** [Dec. 20xy, Batch-Run=End-Of-Day, Delay<1hour] **1**

**Operational-Control.Timely.IntradayP&L Scale:** number of times per day the intraday P&L process is delayed more than 0.5 sec.

**Operational-Control.Timely.Trade-Bookings Scale:** number of trades per day that are not booked on trade date. **Past** [April 20xx] **20 ?**

**From Office Trade Management Efficiency Scale:** time from Ticket Entered to Trade updating real-time risk view

**Past** [20xx, Function = Risk Mgt, Region = Global] **~ 80s +/- 45s ??**

**Goal** [End 20xz, Function = Risk Mgt, Region = Global] **~ 50% better?**

Managing Risk – Accurate – Consolidated – Real Time

**Risk.Cross-Product Scale:** % of financial products that risk metrics can be displayed in a single position blotter in a way appropriate for the trader (i.e. – around a benchmark vs. across the curve).

**Past** [April 20xx] **0% 95%.**

**Goal** [Dec. 20xy] **100%**

**Risk.Low-latency Scale:** number of times per day the intraday risk metrics is delayed by more than 0.5 sec. **Past** [April 20xx, NA] **1%** **Past** [April 20xx, EMEA] **??%** **Past** [April 20xx, AP] **100%** **Goal** [Dec. 20xy] **0%**

Risk.Accuracy

**Risk. user-configurable Scale:** ??? pretty binary – feature is there or not – how do we represent?

**Past** [April 20xx] **1%** **Goal** [Dec. 20xy] **0%**

**Operational Cost Efficiency Scale:** <Increased efficiency (Straight through processing STP Rates )>

**Cost-Per-Trade Scale:** % reduction in Cost-Per-Trade

**Goal** (EOY 20xy, cost type = I 1 – REGION = ALL) **Reduce cost by 60% (BW)**

**Goal** (EOY 20xy, cost type = I 2 – REGION = ALL) **Reduce cost by x %**

**Goal** (EOY 20xy, cost type = E1 – REGION = ALL) **Reduce cost by x %**

**Goal** (EOY 20xy, cost type = E 2 – REGION = ALL) **Reduce cost by 100%**

**Goal** (EOY 20xy, cost type = E 3 – REGION = ALL) **Reduce cost by x %**

**EXAMPLE****Usability:**

Type: Complex Quality Requirement.

Includes: Type: Elementary Quality Requirement {Entry Conditions, Training Requirement, Computer Familiarity, Web Experience Level, Productivity, Error Rate, Likeability, Intuitiveness, Intelligibility}.

**Entry Conditions:**

Scale: <Grade Level of User>.

**Training Requirement:**

Scale: Time needed to read <any instructions> or get <any help> in order to perform defined [Tasks] successfully.

**Computer Familiarity:**

Scale: Years of <experience with computers>.

**Web Experience Level:**

Scale: Years of <experience with using the web>.

**Productivity:**

Scale: Ability to correctly produce defined [Work Units: Default: Completed Transactions].

**Error Rate:**

Scale: Number of Erroneous Transactions requiring correction each <session>.

**Likeability:**

Scale: Option of <pleasure> on using the system on scale of -10 to +10.

**Intuitiveness:**

Scale: Probability that a defined [User] can intuitively figure out how to do a defined [Task] correctly (without any errors needing correction).

**Intelligibility:**

Scale: Probability in % that a defined [User] will correctly interpret defined [Messages or Displays].

## Erieye, from CE chapter 5

### Usability.Intuitiveness:

**Ambition:** High probability that an operator will within a specified time from deciding the need to perform a specific task (without reference to handbooks or help facility) find a way to accomplish their desired task.

**Scale:** Percentage Probability that a defined [Individual Person: Default: Trained Operator] will find a way to perform a defined [Task Type] without reference to any written instructions, other than the help or guidance instructions offered by the immediate system screen (that is, no additional paper or on-line system reference information), within a defined [Time Period: Default: Within one second from deciding that it is necessary to perform the task].

**Comment [Intuitiveness:Scale]:** "I'm not sure if one second is acceptable or realistic, it's just a guess" <- MAB.

**Meter:** To be defined. Not crucial this 1st draft <- TG.

**Past [System R]:** 80%? <- LN.

**Record [Mac User Interface]:** 95%? <- TG.

**Fail [Trained Operator, Rare Tasks [{<1/week, <1/year}]]:** From 50% to 90%? <- MAB.

**Goal [Tasks Done [<1/week (but more than 1/Month)]]:** 99%? <- LN,

    [Tasks Done [<1/year]]: 20%? <- JB,

    [Turbulence, Tasks Done [<1/year]]: 10% ? <- TG.

===== User Defined Terms =====

**Trained Operator:** Defined As: Command and Control Onboard Operator, who has been through approved training course of at least 200 hours duration.

**Rare Tasks:** Defined As: Types of tasks performed by an Onboard Operator less than

Operational-Control: Scale: % of trades per day, where the calculated economic difference between OUR CO and Marketplace/Clients, is less than "1 Yen"(or equivalent).

Past [April 20xx] 10%

Goal [Dec. 20xy] 100%

Operational-Control:

Scale: % of trades per day, where the calculated economic difference between OUR CO and Marketplace/Clients, is less than "1 Yen"(or equivalent).

Past [April 20xx] 10%

Goal [Dec. 20xy] 100%

RISK. user-configurable Scale: ??? pretty binary – feature is there or not – how do we represent?

Past [April 20xx] 1% Goal [Dec. 20xy] 0%

Quantification of the most-critical project objectives on day 1

# Focus

guided by  
**Quantified Goal** sets,  
the need to **estimate** , give **evidence**,  
state **uncertainty** and assign **credibility**.  
All culminating in decision documentation  
which is auditable reviewable. Improvable and transparent!

# Design: Means: Strategy: Architecture

Don't we need more detail to estimate costs and other attributes of a design?

## *Simple design description*

- Design Spec:

– Risk and P/L  
aggregation  
service

Ask the following questions about such brief design descriptions

- What will it cost to develop?
- What will it cost to operate?
- Will we deliver any or all of the quality and performance Goal levels on time?
- What are the critical assumptions, that might fail or be untrue?
- What are the known risks?
- Do we actually understand anything of consequence from such a short design specification?

# The architecture needs

- If we want to understand costs, impacts priorities and risks early
- More detail

- Rather than,
  - too late

# Same Bank, Later

- An example of defining a major strategy
- On a single page
  - *Do you really want to make do with the usual '1 liner' (Strategy or architecture specification)?*
- This was done In **one** hour, it is NOT time consuming
- We get the detail **needed to manage**
  - Quantification, estimation of costs,
    - and effects
  - Risks
  - Prioritization

# Defining a Design/Solution/Architecture/Strategy (Planguage, CE Design Template)

costs may differ slightly, like \$n mm for hardware. MA AH 3 dec

1. enough detail to estimate, 2. some impact assertion, 3. Assumptions, Risks,

Issues

<b>Orbit Application Note</b> <small>(formal cross reference tag)</small>
<b>Type:</b> Primary Architecture Option
===== Basic Information =====
<b>Version:</b> Nov. 30 20xx 16:49, updated 2 Dec by telephone and in meeting 16:34
<b>Status:</b> Draft
<b>Owner:</b> Brent Barclays
<b>Expert:</b> Raj Shell, London
<b>Authority:</b> for differentiating business environment characteristics, Raj Shell, Brent Barclays(for overview)
<b>Source:</b> <source references for the information in this specification. Could include people>. Various, can be done later BB
<b>Gift:</b> risk and P/L aggregation service, which also provides work flow/adjustment and outbound and inbound feed support. Currently used by Rates ExtraBusiness, Front Office and Middle Office, USA & UK.
<b>Description:</b> <Describe the design idea in sufficient detail to support the estimated impacts and costs given below.
D1: ETL Layer. Rules based highly configurable implementation of the ETL Pattern, which allows the data to be onboarded more quickly. Load and persist new data very quickly. With minimal development req
D2: high performance risk and P/L aggregation processing (Cube Building). -> Timeliness, P/L <u>Explanation: Risk &amp; P/L Understanding, Decision Support, Business Scalability, Responsiveness</u>
D3: Orbit supports BOTH Risk and P/L. -> P/L <u>Explanation: Risk &amp; P/L Consistency, Risk &amp; P/L Understanding, Decision Support</u>
D4: a flexible configurable workflow tool, which can be used to easily define new workflow processes -> Books/Records Consistency, Business Process Effectiveness, Business Scalability, Time to Market
D5: a report definition language, which provides 90% of the business logic contained with Orbit, allows a quick turnaround of new and enhanced reports with minimal regression testing and release procedure impact -> P/L <u>Explanation: Risk &amp; P/L Understanding, Business Scalability, Time to Market, Business Scalability</u>
D6: Orbit GUI. Utilizes an Outlook Explorer metaphor for ease of use, and the Dix Express Grid Control, to provide high performance Cube Interrogation Capability. -> Responsiveness, <u>People Interactivity, Decision Support, Risk &amp; P/L Understanding</u>
D7: downstream feeds. A configurable event-driven data export service, which is used to generate feeds. -> Business Process Effectiveness, Business Scalability, Time to Market

A4: the schedule, 3 years, will constrained to a scope we can in fact deliver, OR we will be given additional budget. If not “I would have a problem” <- BB

A5: the cost of expanding Orbit will not be prohibitive. <- BB 2 dec

de the assumption that we can integrate Orbit with Px+ /, even in the short term <- BB

y dependencies for this design idea>.

s Px+ in time. ? tsg 2.12

tags of any factors, which could threaten your estimated

ved. Mitigation: continue to use Pxx <- tsg 2.12

l integration of Px+ is not as easy as thought & we must

R3: the and or scalability and cost of **coherence** will not allow us to meet the delivery.

R4: **scalability** of Orbit team and infrastructure, first year especially <- BB. People, environments, etc.

R5: re Cross Desk reporting Requirement, major impact on technical design. **Solution not currently known.** Risk no solution allowing us to report all P/L

# Design Spec Enlarged 1 of 2

Type: Primary Architecture Option  
**Spec Headers**

**Detailed Description and -> Impacted Objectives**  
Description: <Describe the design idea in sufficient detail to support the estimated impacts and costs given below>.

==== Basic Information =====

**Version:** Nov. 30 20xx 16:49,  
updated 2.Dec by telephone and in  
meeting. 14:34

**Status:** Draft (PUBLIC EXAMPLE  
EDIT)

**Owner:** Brent Barclays

**Expert:** Raj Shell, London

**Authority:** for differentiating  
business environment  
characteristics, Raj Shell, Brent  
Barclays(for overview)

**Source:** <Source references for the  
information in this specification.  
Could include people>. Various, can  
be done later BB

**Gist:** risk and P/L aggregation  
service,

**D1:** ETL Layer. Rules based highly configurable implementation of the ETL Pattern, which allows the data to be onboarded more quickly. Load and persist new data very quickly. With minimal development required. -> Business-Capability-Time-To-Market, Business Scalability

**D2:** high performance risk and P/L aggregation processing (Cube Building). -> Timeliness, P/L Explanation, Risk & P/L Understanding, Decision Support, Business Scalability, Responsiveness.

**D3:** Orbit supports BOTH  
& P/L Understanding, Deci

**D4:** a flexible configurable  
workflow processes -> Boo  
Capability Time to Market

**D5:** a report definition lan  
Orbit, allows a quick turn  
testing and release proced  
Business Capability Time t

**D6:** Orbit GUI. Utilizes an  
Express Grid Control, to p  
Responsiveness, People Int

**D7:** downstream feeds. A  
generate feeds . -> Busin

The Detailed description is  
useful,

- to understand costs
- to understand impacts  
on your objectives (see '-  
>')
- to permit separate  
implementation and value  
delivery, incrementally

10 October  
which also provides work flow

# Design Spec Enlarged 2 of 2

## ==== Priority & Risk Management =====

**Assumptions:** <Any assumptions that have been made>.

A1: FCCP is assumed to be a part of Orbit. FCxx does not currently exist and is Dec 20xx 6 months into Requirements Group. Picked up by TsG from dec 2 discussions AH

Consequence: FCxx must costs rating.

A2: **Costs**, the development costs budget of say \$ nn mm and 3 yea like \$n mm for hardware. MA AH

A3: Boss X will continue to own O

A4: the schedule, 3 years, will co deliver, OR we will be given addit problem" <- BB

A5: the cost of expanding Orbit v

A6: we have made the assumption in a sensible way, even in the short term <- BB

**Dependencies:** <State any dependencies for this design idea>.

D1: FCxx replaces Px+ in time. ? tsg 2.12

**ASSUMPTIONS:**

- broadcasts critical factors for present and future re-examination
- helps risk analysis
- are an integral part of the design specification

**DEPENDENCIES:**

**Risks:** <Name or refer to tags of any factors, which could threaten your estimated impacts>.

R1. FCxx is delayed. Mitig

R2: the technical integre redevelop Orbit

R3: the and or scalability delivery.

R4: **scalability** of Orbit People, environments, etc

R5: re Cross Desk report Solution not currently k

**Issues:** <Unresolved concerns or problems in the specification or the system>.

I1: Do we need to put the fact t (Ownership). MA said, other agre

I2: what are the time scales and

I3: what will the success factors being asked to do. BB 2 dec 20xx

I4: for the business other than f to what the requirements are an Options. BB

I5: the degree to which this opt Day. BB 2 dec

**Risks specification:**

- shares group risk knowhow
- permits redesign to mitigate the risk
- allows relistic estimates of cost and impacts

**Issues:**

- when answered can turn into a risk
- shares group knowledge
- makes sure we don't forget to analyze later

## 4. Case Studies, Examples

- " Persinscom (whole front end process week)
- " Bring (hierarchical tables)
- " Confrimit (active project value delivery)

# The 'Evo' Planning Week at DoD

## Monday

Define top Ten critical objectives, quantitatively

Agree that thee are the main points of the effort/project

## Tuesday

Define roughly the top ten most powerful strategies for enabling us to reach our objectives on time

## Wednesday

Make an Impact Estimation Table for Objectives/Strategies

Sanity Test: do we seem to have enough powerful strategies to get to our Goals, with a reasonable safety margin?

**A tool for decomposing the value steps and seeing best value for resources**

## Thursday

**Divide into rough delivery steps (annual, quarterly)**

**Derive a delivery step for 'Next Week'**

## Friday

**Present these plans to approval manager (Brigadier General Pellicci)**

**get approval to deliver next week**

**(they can't resist results next week!)**

US Army Example: PERSINSCOM

Objectives	Strategies	Impact	Resources	Timeline	Approval
1. Increase operational readiness	1.1. Enhance training programs	1.1.1. Improved performance	1.1.1.1. Personnel	1.1.1.1.1. 2023-2024	1.1.1.1.1.1. Approved
2. Reduce maintenance costs	2.1. Implement predictive maintenance	2.1.1. Reduced downtime	2.1.1.1. Equipment	2.1.1.1.1. 2023-2024	2.1.1.1.1.1. Approved
3. Improve logistics efficiency	3.1. Streamline supply chain	3.1.1. Faster delivery	3.1.1.1. Logistics	3.1.1.1.1. 2023-2024	3.1.1.1.1.1. Approved
4. Enhance communication systems	4.1. Upgrade network infrastructure	4.1.1. Increased security	4.1.1.1. IT	4.1.1.1.1. 2023-2024	4.1.1.1.1.1. Approved
5. Strengthen intelligence gathering	5.1. Deploy advanced sensors	5.1.1. Better situational awareness	5.1.1.1. Sensors	5.1.1.1.1. 2023-2024	5.1.1.1.1.1. Approved
6. Optimize personnel deployment	6.1. Utilize data analytics	6.1.1. Improved decision making	6.1.1.1. Analytics	6.1.1.1.1. 2023-2024	6.1.1.1.1.1. Approved
7. Enhance cyber defense capabilities	7.1. Conduct regular security audits	7.1.1. Reduced vulnerabilities	7.1.1.1. Cyber	7.1.1.1.1. 2023-2024	7.1.1.1.1.1. Approved
8. Improve public relations	8.1. Engage with local communities	8.1.1. Increased trust	8.1.1.1. PR	8.1.1.1.1. 2023-2024	8.1.1.1.1.1. Approved
9. Enhance environmental protection	9.1. Implement sustainable practices	9.1.1. Reduced carbon footprint	9.1.1.1. Environment	9.1.1.1.1. 2023-2024	9.1.1.1.1.1. Approved
10. Strengthen international relations	10.1. Participate in joint exercises	10.1.1. Improved interoperability	10.1.1.1. International	10.1.1.1.1. 2023-2024	10.1.1.1.1.1. Approved

# Decomposition Principles A Teachable Discipline

## The IE Table a tool for decomposition by Value

Decomposition of Projects into small steps 11/12/2008 13:38

**Decomposition of Projects: How to design small, early and frequent incremental and evolutionary feedback, stakeholder result delivery steps, at the level of 2% of project resources.**

By Tom Gilb, Norway

### Introduction

- The basic premise of iterative, incremental and evolutionary project management [Larman 03 MG] is that a project is divided into early, frequent and short duration delivery steps.
- One basic premise of these methods is that each step will attempt to deliver some real value to stakeholders.
- It is not difficult to envisage steps of *construction* for a system; the difficulty is when a step has to *deliver* something of *value* to *stakeholders*, in particular to end users.
- This paper will give some teachable guidelines, policies and principles for decomposition. It will also give short examples from practical experience.

### A Policy for Evo Planning

One way of guiding Evo planners is by means of a 'policy'. A general policy looks like this (you can modify the policy parameters to your local needs):

Evo Planning Policy (example)

**P1: Steps will be sequenced on the basis of their overall benefit-to-cost efficiency.**

**P2: No step may normally exceed 2% of total project financial budget.**

# Decomposition Principles

How to decompose systems into small evolutionary steps:

some principles to apply:

1• ***Believe*** there is a way to do it, you just have not ***found*** it yet!

2• ***Identify*** obstacles, but don't use them as excuses: use your imagination to get ***rid*** of them!

3• Focus on ***some usefulness*** for the user or customer, however small.

4• Do **not** focus on the design ideas themselves, they are distracting, especially for small initial cycles. Sometimes you have to ignore them entirely in the short term!

5• Think; one customer, tomorrow, one interesting improvement.

6• Focus on the ***results*** (which you should have defined in your goals, moving toward target levels).

7• Don't be afraid to use temporary-scaffolding designs. Their cost must be seen in the light of the value of making some progress, and getting practical experience.

8• Don't be worried that your design is inelegant; it is results that count, not style.

9• Don't be afraid that the customer won't like it. ***If*** you are focusing on results ***they want***, then by definition, ***they*** should like it. If you are not, then ***do!***

10• Don't get so worried about "what might happen afterwards" that you can make no practical progress.

11• You cannot foresee everything. Don't even ***think*** about it!

12• If you focus on helping your customer in practice, ***now***, where they ***really*** need it, you will be forgiven a lot of 'sins'!

13• You can understand things much better, by getting ***some*** practical experience (and removing ***some*** of your fears).

14• Do ***early*** cycles, on willing local mature parts of your user community.

15• When some cycles, like a purchase-order cycle, take a long time, initiate them ***early***, and do other useful cycles while you wait.

16• If something seems to need to wait for 'the big new system', ask if you cannot usefully do it with the 'awful old system', so as to pilot it realistically, and perhaps alleviate some 'pain' in the old system.

17• If something seems too costly to buy, for limited initial use, see if you can negotiate some kind of 'pay as you really use' contract. Most suppliers would like to do this to get your patronage, and to avoid competitors making the same deal.

18• If ***you*** can't think of some useful small cycles, then talk directly with the real 'customer' or end user. They probably have dozens of suggestions.

19• Talk with end users in ***any*** case, they have insights you need.

20• Don't be afraid to use the old system and the old 'culture' as a launching platform for the radical new system. There is a lot of merit in this, and many people overlook it.

I have never seen an exception in 33 years of doing this with many varied cultures. Oh Ye of little faith!

# Rene Descartes on Focus

- **"We should bring the whole force of our minds**
  - **to bear upon the most minute and simple details**
  - **and to dwell upon them for a long time**
  - **so that we become accustomed to perceive the truth clearly and distinctly."**
- **Rene Descartes, Rules for the Direction of the Mind, 1628**

道

道可道  
非常道  
名可名  
非常名

# Tao Te Ching (500BC)

- **That which remains quiet, is easy to handle.**
- **That which is not yet developed is easy to manage.**
- **That which is weak is easy to control.**
- **That which is still small is easy to direct.**
- **Deal with little troubles before they become big.**
- **Attend to little problems before they get out of hand.**
  - **For the largest tree was once a sprout,**
- **the tallest tower started with the first brick,**
- **and the longest journey started with the first step.**

# Customer Successes in Corporate Sector

# Real Example of 1 of the 25 Quality Requirements

**Usability.Productivity** *(taken from Confirmit 8.5,*  
**performed a set of predefined steps, to produce a**  
**standard MR Report.**

*development)*

**Scale for quantification: Time in minutes to set up a**  
**typical specified Market Research-report**

**Past Level [Release 8.0]: 65 mins.,**

**Tolerable Limit [Release 8.5]: 35 mins.,**

**Goal [Release 8.5]: 25 mins.**

**Note: end result was actually 20**  
**minutes 😊**

**Meter [Weekly Step]: Candidates with Reportal**  
**experience, and with knowledge of MR-specific**  
**reporting features**

# Shift: from Function to Quality

- **" Our new focus is on the day-to-day operations of our Market Research users,**
  - **"not a list of features that they might or might not like. 50% never used!**
  - **" We KNOW that increased efficiency, which leads to more profit, will please them.**
  - **"The '45 minutes actually saved x thousands of customer reports'**
    - **" = big \$\$\$ saved**
- **" After one week we had defined more or less all the requirements for the next version (8.5) of Confirmit.**

Trond Johansen

- " IET for MR Project – Confirmit (<-FIRM Product Brand) 8.5
- " **Solution:** Recoding
  - " Make it possible to recode variable on the fly from Reportal.
  - " Estimated effort: 4 days
  - " **Estimated** Productivity Improvement: 20 minutes (50% way to Goal)
  - " actual result 38 minutes (95% progress towards Goal)

# Evo's impact on Confirmit product qualities 1<sup>st</sup> Qtr

- " Only 5 highlights of the 25 impacts are listed here

Description of requirement/work task	Past	Status
Usability.Productivity: Time for the system to generate a survey	7200 sec	15 sec
Usability.Productivity: Time to set up a typical specified Market Research-report (MR)	65 min	20 min
Usability.Productivity: Time to grant a set of End-users access to a Report set and distribute report login info.	80 min	5 min
Usability.Intuitiveness: The time in minutes it takes a medium experienced programmer to define a complete and correct data transfer definition with Confirmit Web Services without any user documentation or any other aid	15 min	5 min
Performance.Runtime.Concurrency: Maximum number of simultaneous respondents executing a survey with a click rate of 20 sec and an response time<500 ms, given a defined [Survey-Complexity] and a defined [Server Configuration, Typical]	250 users	6000

# Initial Customer Feedback on the new Conformat 9.0

November 24th, 2004

# Initial perceived value of the new release (Base 73 people)

**To what extent do you feel Conformat 9.0 will give you additional value?**

# Evo's impact on Conconfirm 9.0 product qualities

## Results from the second quarter of using Evo. 1/2

Product quality	Description	Customer value
Intuitiveness	Probability that an inexperienced user can intuitively figure out how to set up a defined Simple Survey correctly.	Probability increased by <b>175%</b>
Productivity	Time in minutes for a defined advanced user, with full knowledge of 9.0 functionality, to set up a defined advanced survey correctly.	Time reduced by <b>38%</b>

Product quality	Description	Customer value
Productivity	Time (in minutes) to test a defined survey and identify 4 inserted script errors, starting from when the questionnaire is finished to the time testing is complete and is ready for production. (Defined Survey: Complex survey, 60 questions, comprehensive JScripting.)	Time reduced by <b>83%</b> and error tracking increased by 25%

# Evo's impact on Conformat 9.0 product qualities

## Results from the second quarter of using Evo. 2/2

Product quality	Description	Customer value
Performance	Max number of panelists that the system can support without exceeding a defined time for the defined task, with all components of the panel system performing acceptable.	Number of panelists increased by <b>1500%</b>
Scalability	Ability to accomplish a bulk-update of X panelists within a timeframe of Z second	Number of panelists increased by <b>700%</b>
Performance	Number of responses a database can contain if the generation of a defined table should be run in 5 seconds.	Number of responses increased by <b>1400%</b>

# Code quality – "green" week

- " In these "green" weeks, some of the deliverables will be less visible for the end users, but more visible for our QA department.
- " We manage code quality through an Impact Estimation table.

Current Status		Improvement	Goals			Step 6 (week 14)		Step 7 (week 15)

## 6. Standards, Templates, Rules, Principles: The Practical Tools of 'Planguage'

- The array of standards types
- IE Policy
- Concepts, Concept Definition, Glossary
- Rules: best practice specification, defining specification faults in Quality Control
- Processes: recommended work sequences
  - Entry and Exit conditions for processes
- Templates: with 'hints', practical 'rules', and training
- Principles: strong guidelines

# Impact Estimation Policy

- All design ideas or strategies which can have a significant impact (5% or more) on any critical performance or cost requirement of a project must be evaluated in an IE table.
- The design ideas must be specified in sufficient detail and clarity to support IE, irrespective of who would make or evaluate the estimates.
- An IE table, together with all its related design and requirement specifications, must be quality controlled with respect to all the relevant rules. The level of estimated remaining major defects/page must be low enough to exit and it must be stated (ideally on the cover page of the document).
- Significant proposed changes to the design ideas or architecture must be accompanied by a quality controlled IE table showing the net impact of the changes.

- " 9.4 Rules/Forms/Standards: Impact Estimation
- " Tag: Rules.IE.
- " Version: October 7, 2004.
- " Owner: TG.
- " Status: Draft.
- " Base: The generic rules, Rules.GS and the requirement specification rules, Rules.RS apply.

- " R1: Table Format: The requirements must be specified in the left-hand column. The design ideas must be specified along the top row.

# R2: Requirement:

- Each performance requirement (objective) and each resource requirement must be identified by its tag and by a simplified version of the chosen Baseline $\leftrightarrow$ Target Pair (B $\leftrightarrow$ T pair). The B $\leftrightarrow$ T pair should be written under the tag.
- Each B $\leftrightarrow$ T pair must consist of two reference points, the chosen baseline (Past) and the planned target (Goal or Budget). Each reference point must be stated as a numeric value or as a tag to a numeric value. The numeric values must be expressed using the chosen Scale for the requirement.
- The baseline is stated first as it represents the 0% incremental impact point. Then usually an arrow ' $\leftrightarrow$ '. Then the planned target, which represents the 100% incremental impact point.
- It must be possible to distinguish between multiple-level specifications for the same Goal or Budget statement. Where necessary, to be unambiguous, use a qualifier or tag the specific baseline and/or target for use in the IE table.

# EXAMPLE

- " Reliability:  
Type: Performance Requirement.
- " Baseline  $\leftrightarrow$  Target Pair:
  - " Benchmark Reliability  $\leftrightarrow$  30,000 hours  
[USA, Next Year].
- " Note: Reliability and Benchmark Reliability  
are tags.

# R3: Qualifiers:

- If there is one common set of qualifier [time, place and event] conditions for reaching all targets,
  - this should be explicitly stated in the notes accompanying the IE table.
  - If the qualifiers vary then they must be explicitly stated next to the relevant B $\leftrightarrow$ T pair.
- By default, the entire system is implied
  - and no specific conditions are assumed.
  - The deadline time period must always be explicitly stated.

# R4: Design Idea:

- Each single column must identify a design idea
  - or set of design ideas that could be implemented as a distinct Evo step.
  - Each design idea must be identified by its tag.
  - Multiple tags may be specified as a set of design ideas in a single column.
  - All tags must be supported by a design specification,
    - which must exist in the supporting documentation and must be sufficiently detailed to allow impact estimations to the required level of accuracy.
    - As a minimum, each design specification must be sufficiently detailed to permit financial cost to be estimated to within an 'order of magnitude.'

# R5: Scale Impact:

- " For each goal or budget,
  - " the Scale Impact is the estimated or actual performance or cost level respectively
    - " (expressed using the relevant Scale)
- " that is brought about by implementing the design idea(s) in each column.

# R6: Percentage Impact

- " : The Percentage Impact is a percentage (%) value
  - " derived from the Scale Impact
  - " (see Rules.IE.R2).
  - " An estimate of zero percent, '0%,' means the impact of the implementation of this design idea is estimated to be equal to the specified baseline level of the objective.
  - " '100%' means the specified target level would probably be met exactly and on time.
  - " All other percentage estimates are in relation to these two points.
  - " Note: In an IE table, it is acceptable to specify either Percentage Impacts and/or the Scale Impacts (the absolute values on the defined scale of measure).
  - " Examples: 60%, 4 minutes.

# R7: Uncertainty:

- The  $\pm$  Uncertainty
- (based on the evidence experience borders)
- of the Scale Impact estimate shall normally be specified.
- Percentage Uncertainty values are then calculated in a similar way to the Percentage Impacts.
- Example:  $60\% \pm 20\%$ .
- Usually, the uncertainty values are calculated individually for each cell.
  - An exception to this occurs when some overall uncertainty (such as  $\pm 50\%$ ) is declared for the whole table or specified parts of it.
  - Another more fundamental exception can be when a decision is made to defer dealing with uncertainty data.

# R8: Evidence:

- Each estimate must be supported by facts
  - that credibly show how it was derived.
- Numbers, dates and places are expected.
- If there is no evidence,
  - a clear honest risk-identifying statement
    - expressing the problem is expected
    - (such as 'Random Guess' or 'No Evidence').
- The exact source of the evidence must also be explicitly stated.
- Note: Reference to a specific section of a document is permitted as evidence.

# R9: Credibility:

- " The evidence, together with its source, must be rated for its level of credibility on a scale of 0.0 (no credibility) to 1.0 (perfect credibility).
- " The relevant standard Credibility Ratings Table must be considered for use.
- " Explanation must be given if alternative ratings are chosen.

# Credibility Table

<i>Credibility Rating</i>	<i>Meaning</i>
0.0	Wild guess, no credibility
0.1	We know it has been done somewhere
0.2	We have one measurement somewhere
0.3	There are several measurements in the estimated range
0.4	The several measurements are relevant to our case
0.5	The method used to obtain the several relevant measurements is considered reliable
0.6	We have used the method/design/idea/strategy in-house
0.7	We have reliable measurements for the design idea in-house
0.8	Reliable in-house measurements correlate to independent external measurements
0.9	We have used the idea on this project and measured it (Evo step, pilot and field trial)
1.0	Perfect credibility, we have rock solid, contract-guaranteed, long-term and credible experience with this idea on this project and,

# R10: Completeness:

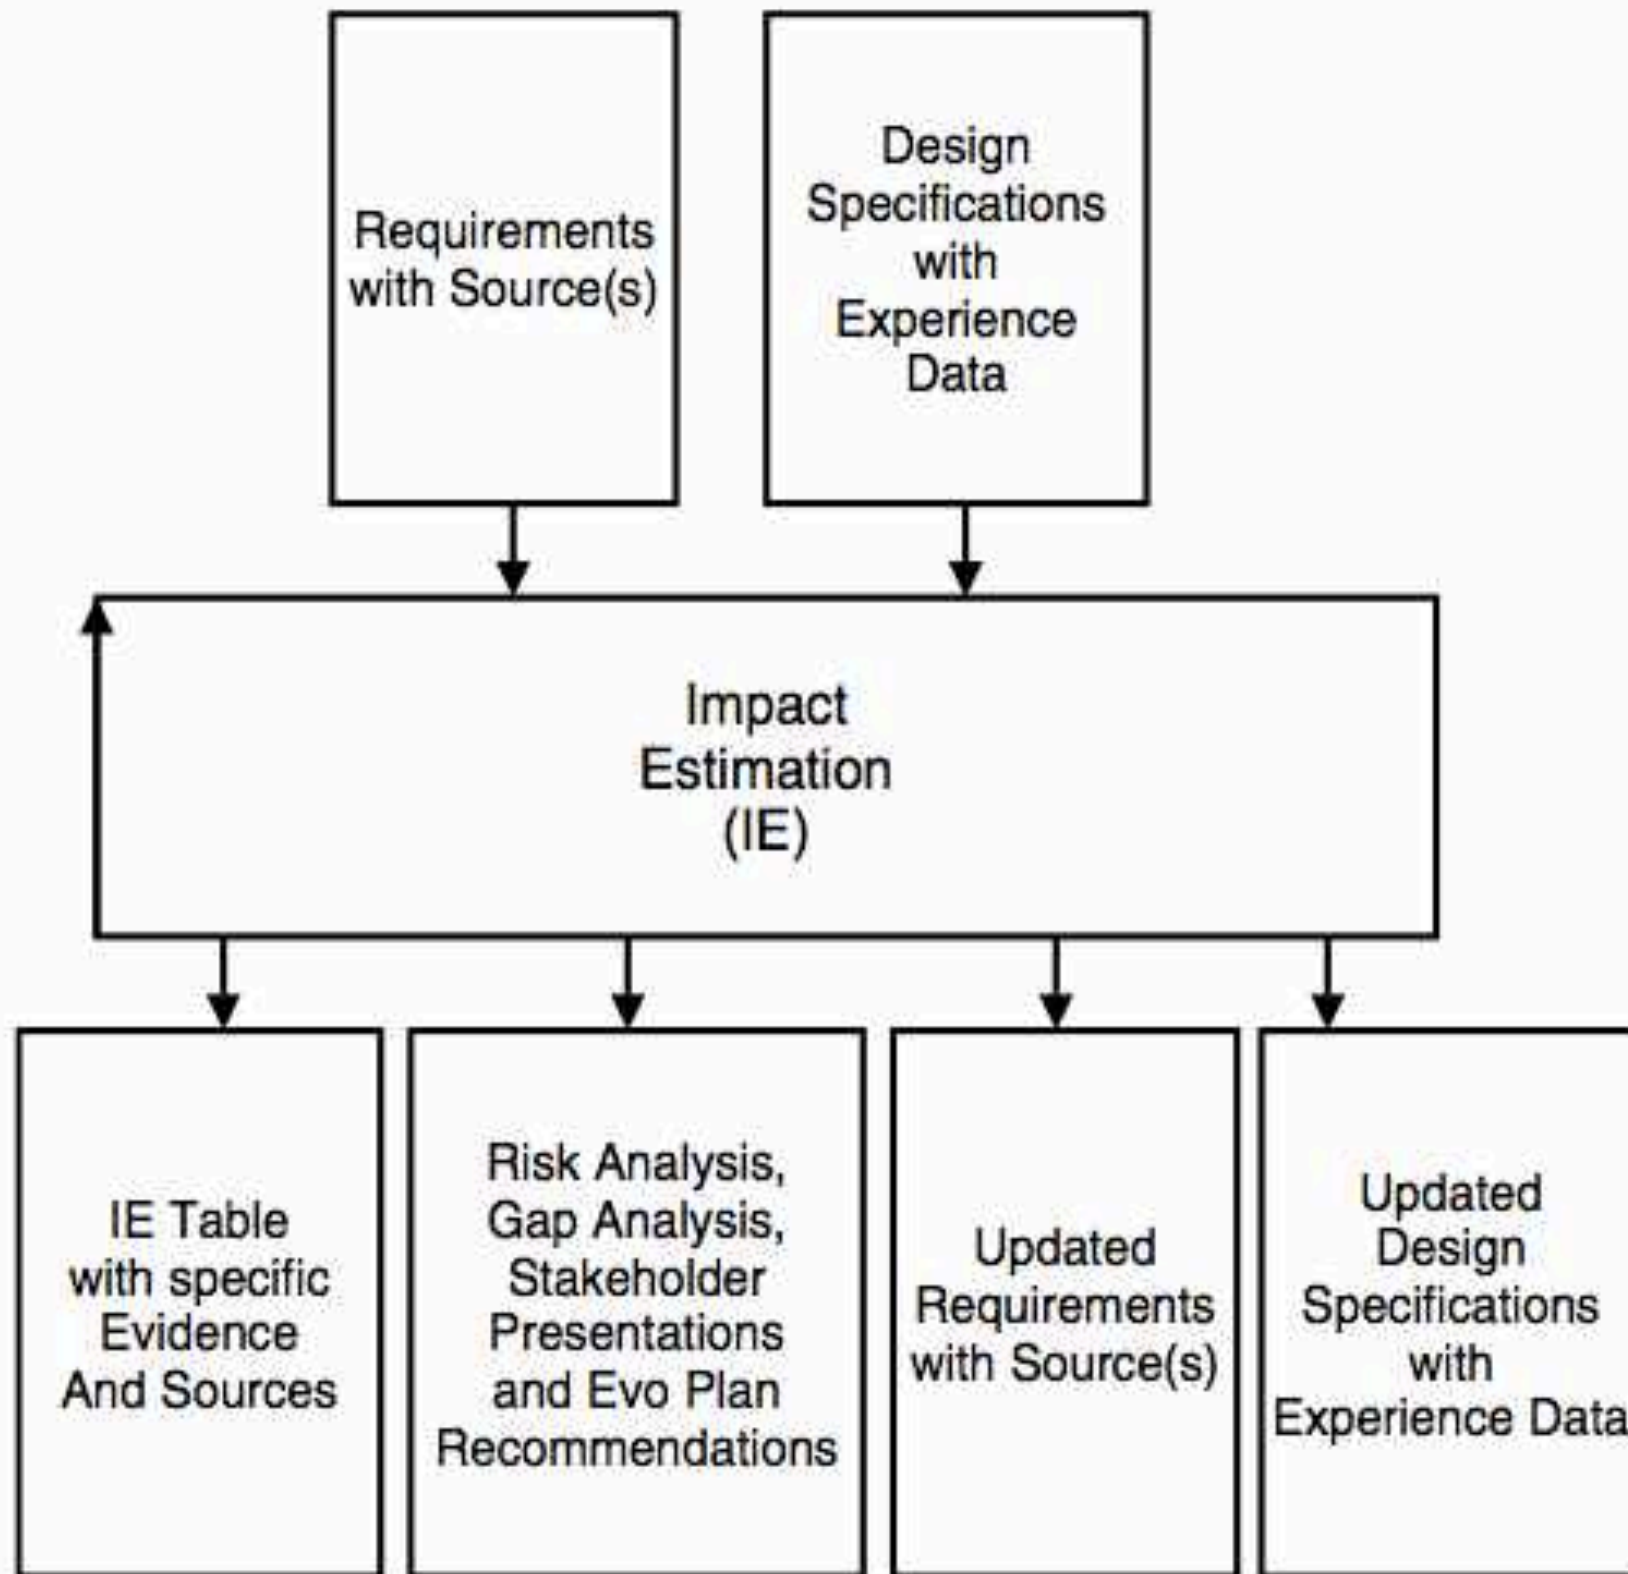

- All IE cells (intersections of a design idea and a requirement) must have a non-blank statement of estimated impact.
- This must be given as a numeric value
  - using the relevant Scale units, or as a Percentage Impact as assessed against the defined Baseline  $\leftrightarrow$  Target Pair, or both.
- If there is no estimate, then a clear indication of this must be given.

**R11: Calculations:** All the appropriate IE calculations must be carried out and the arithmetic must be correct. Hint: Using an application, such as a spreadsheet, helps! The IE calculated values include:

- . Percentage Impact: See Rule R6.
- . Percentage Uncertainty: See Rule R7.
- . Sum of Performance: For each design idea, an algebraic sum of its
- Percentage Impacts on all the performance requirements. (A 'vertical' sum.)
- . Sum of Costs: For each design idea, an algebraic sum of all its
- Percentage Impacts on the selected resource requirements. ('Selected' as it might well not make sense to sum all the costs represented in an IE table.) (A 'vertical' sum)
- . Sum of Scale Costs: For each design idea, an algebraic sum of all its Scale Impacts on the selected resource requirements. (A 'vertical' sum.)
- . Performance to Cost Ratio: The performance to cost ratios are calculated using either (Sum of Performance/Sum of Costs or
- Sum of Performance/Sum of Scale Costs).
- . Sum for Requirement: For each requirement, an algebraic sum of all
- the Percentage Impacts for the simultaneously applicable and compatible design ideas. (A 'horizontal' sum.)
- . Safety Deviation: For each requirement, subtract the Safety Margin
- from the Sum for Requirement. The relevant standard safety margin must be considered for use. Explanation or justification must be given if an alternative safety margin is chosen for use. By default, a standard safety margin of factor 2 (200% for performance requirements, 50% for budgets) will be used. For example, if the required safety margin is 200% and Sum for Requirement for a performance requirement is 120%, then "80%" is the deviation to be displayed. (A 'horizontal' sum.)
- . Calculate all the relevant (□) uncertainty values. Base this on best case and worst case observations or estimates.

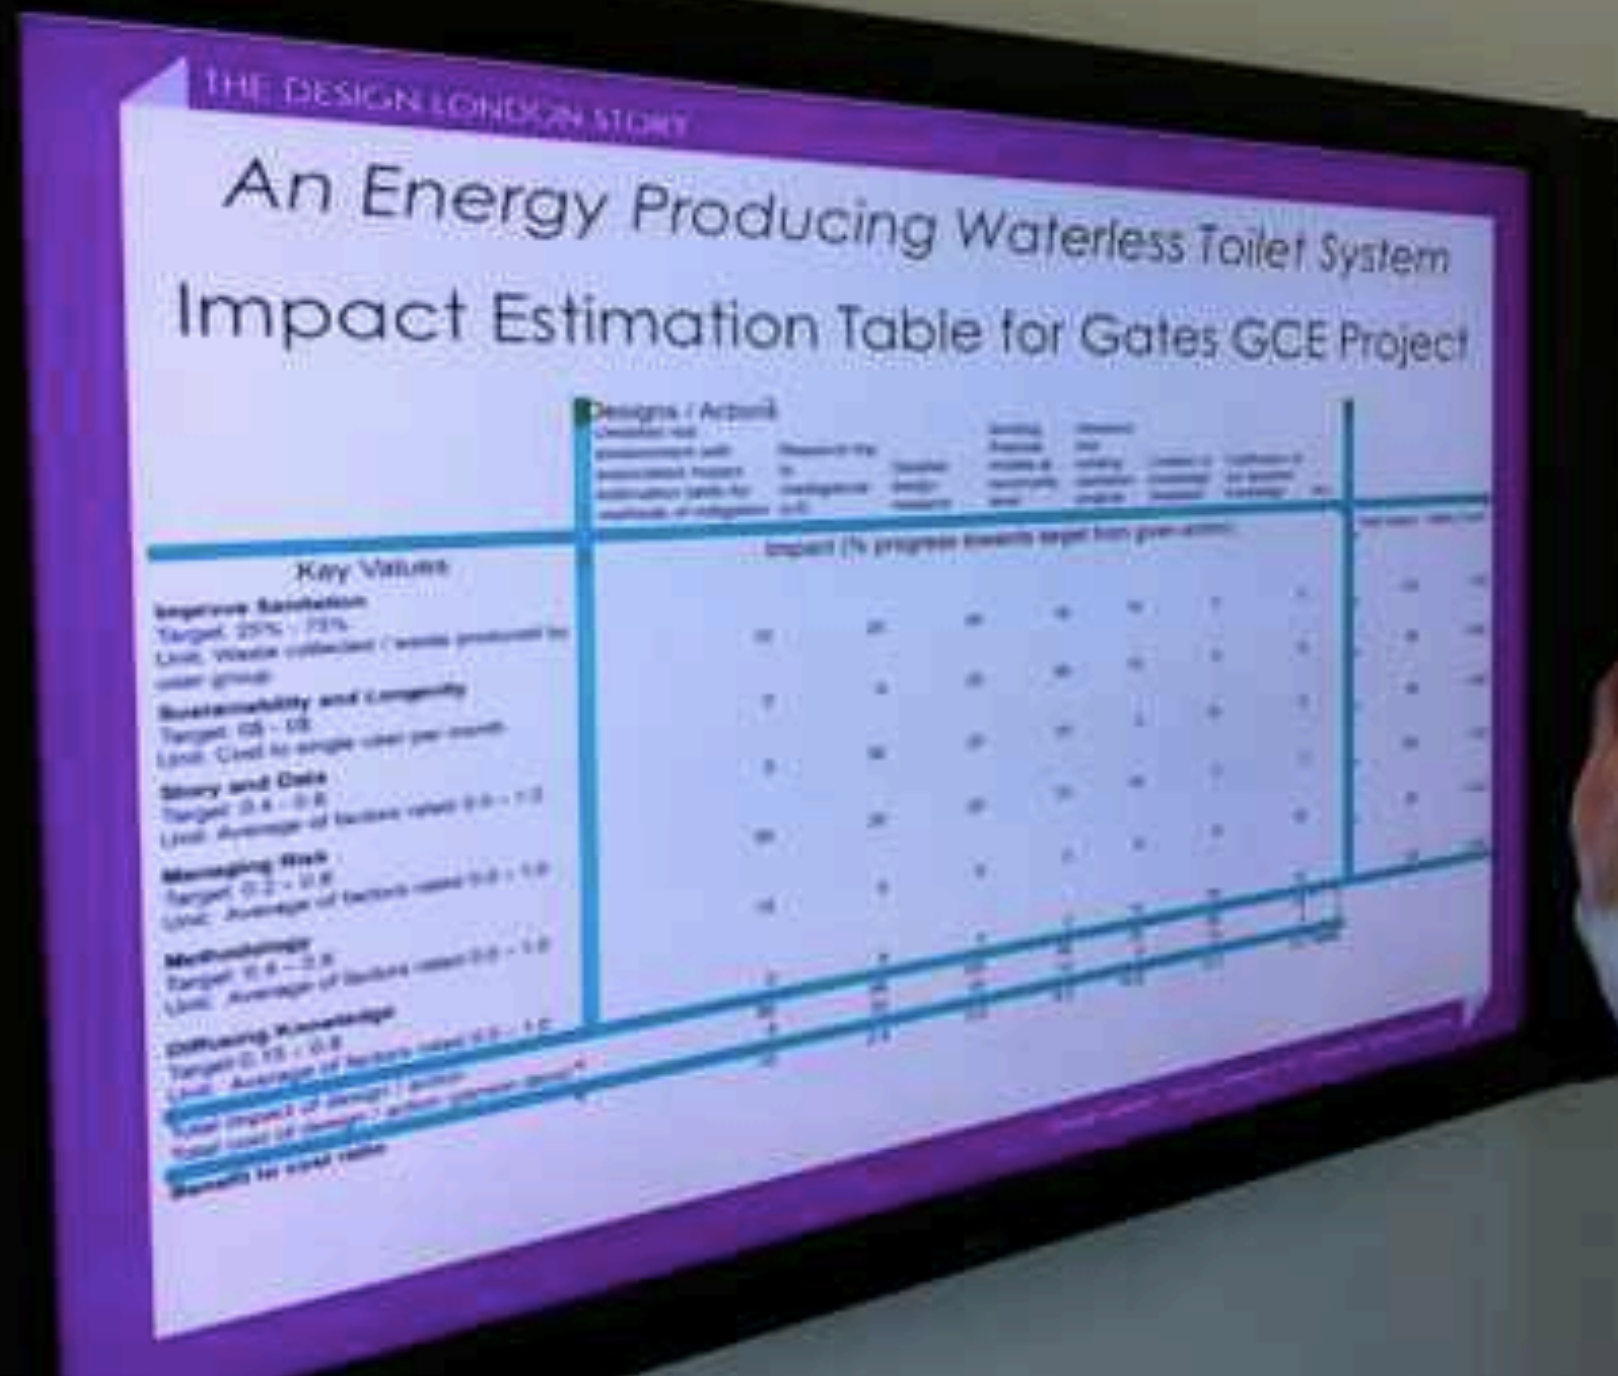

# IE Process

# IE Principles

# IET Principles

# The Principles of Impact Estimation

- " 1. The Principle of 'Words being difficult to weigh'  
Non-numeric estimates of impact are difficult to analyze and improve upon. A design idea described as 'excellent' could actually be worse than another merely described as 'good.'
- "
- " 2. The Principle of 'Doubtful digits are better than none'  
A bad numeric estimate, and its definition, can still be systematically criticized and improved. In fact, a random number is a better starting estimate than flowery, descriptive words.
- "
- " 3. The 'Evident' Principle  
Estimates without sources, evidence and credibility are not evident.
- "
- " 4. The Principle of 'Uncertainty in no uncertain terms'  
The uncertainty estimate is at least as important as the main estimate.
- "
- " 5. The Principle of the 'Seat Belt'  
A safety margin is as necessary with uncertain

- " 6. The Principle of 'Profitable Proposals'  
The value of an idea is how well it meets objectives. The net value considers the costs too.

7. The Principle of 'the Swiss Army Knife'  
Impact Estimation is a multi-purpose method. It can help you in many situations: to evaluate, to compare, to present, to argue, to destroy, to find weaknesses, to cut fat, to see risk, to prioritize, to sequence and more.

8. The Principle of 'Always Useful'  
Impact Estimation can assist a project throughout its lifecycle – from identifying requirements to assessing feedback data from implemented systems.

9. The Principle of 'Multiplicity'  
When stakeholders have multiple need to evaluate multiple design requirements including considerations make a reasonable choice.

10. The Efficiency Principle  
When real life has many stakeholder constraints, then evaluation of design is done with respect to both the value and the cost.

- "1. The Principle of 'Words being difficult to weigh'
- "Non-numeric estimates of impact
  - "are difficult to analyze and improve upon.
  - "A design idea described as 'excellent'
  - "could actually be worse than another
  - "merely described as 'good.'

- "2. The Principle of 'Doubtful digits are better than none'

- "A bad numeric estimate, and its definition,
  - "can still be systematically criticized and improved.
- "In fact, a random number is a better starting estimate
  - "than flowery,

Another method for square root is iteration.

[view source](#)

[print](#)  
[?](#)

```
function sqrtByIteration( $number , &$time )
{
    $start = microtime();
    if( $number < 0 )
        return;

    // Guess a number
    $guess = round( $number / 7, 10 );
    $found = 0;
    $i = 1;

    // Iterate while guessed number is not equal to the found
    number from the formula
    while( $guess != $found )
    {
        if( $found )
            $guess = $found;

        $found = ( ( $number / $guess ) + $guess ) / 2;
```

- "3. The 'Evident' Principle

- "Estimates without
  - Sources, evidence and credibility
  - "are not evident.

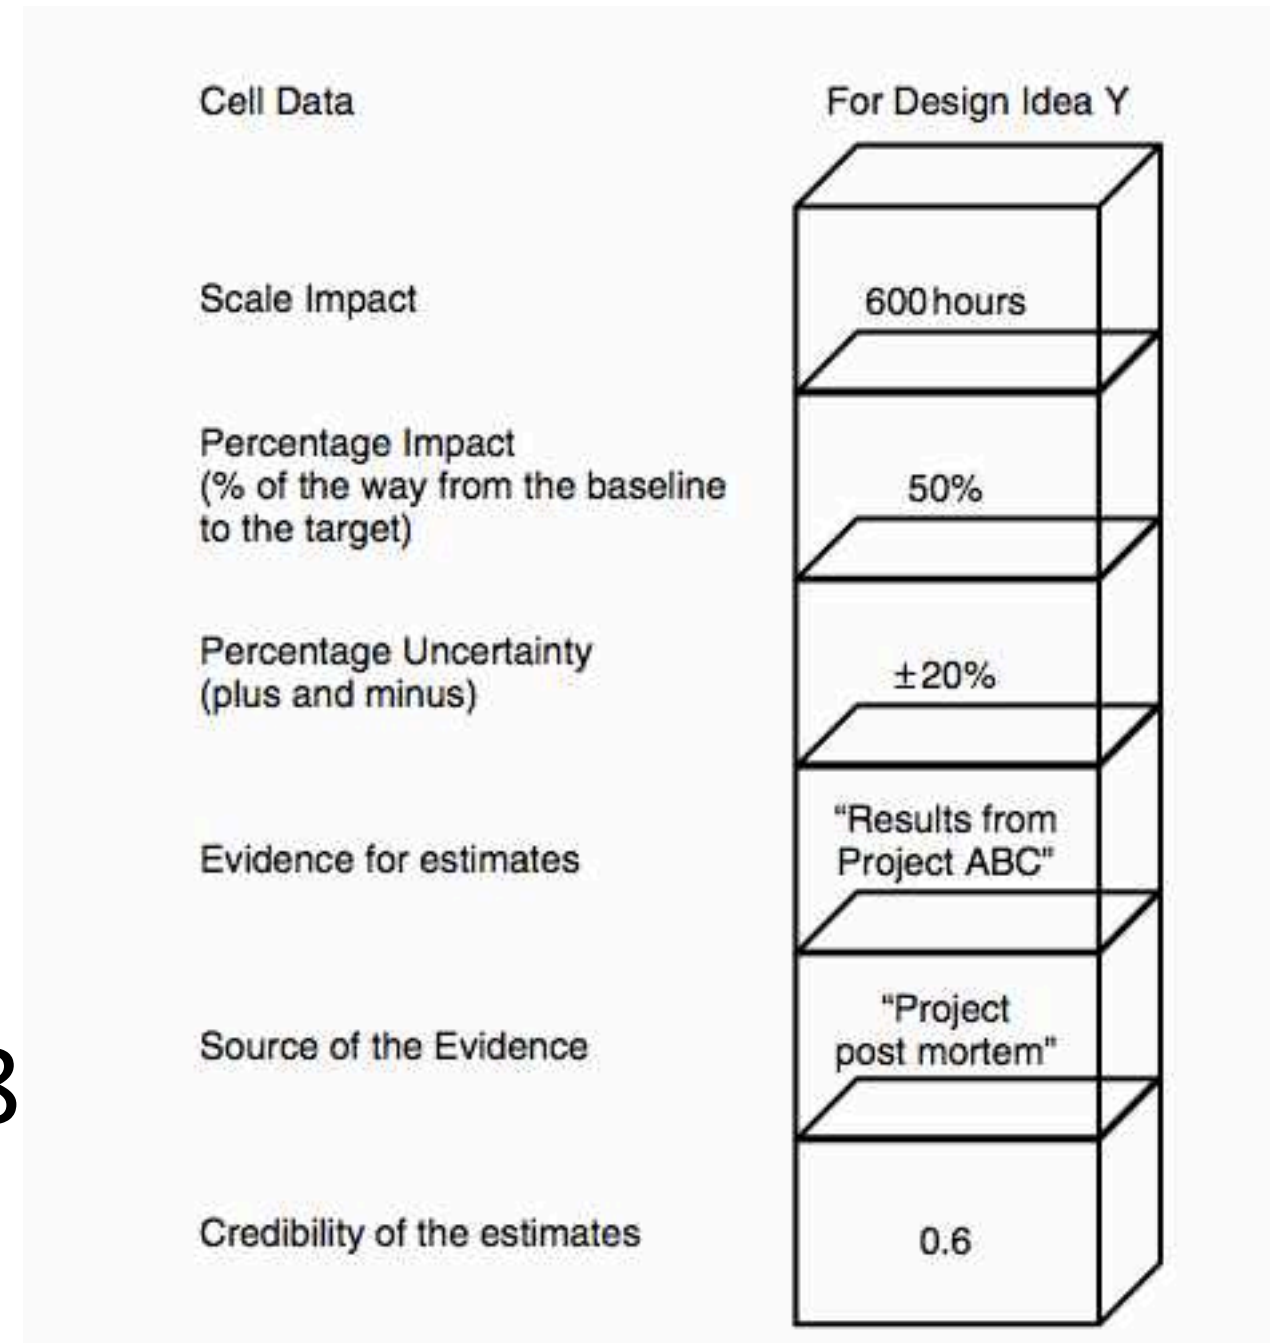

"Facts are stubborn things; and whatever may be our wishes, our inclinations, or the dictates of our passions, they cannot alter the state of facts and evidence." -- John Adams

# The Data Elements for one IE Cell

- "Design X:"
- "Description: x....x"
- "Impacts: Usability"
- "Impact: 20 minutes"
- "Impact %: 50%"
- "Uncertainty:  $\pm 40\%$ "
- "Evidence: Saves 12 to 28 m."
- "Source: Report XYZ, pp 33-35"

# Evidence

- "It has been said that man is a rational animal.
- "All my life I have been searching for evidence which could support this.
- "Bertrand Russell

# Evidence

- "The most savage controversies are those about matters as to which there is no good evidence either way.
- "Bertrand Russell

- "4. The Principle of 'Uncertainty in no uncertain terms'

- "The uncertainty estimate is
- "at least as important
- "as the main estimate.

# ± Uncertainty: Spread

Example of a Simple Impact Estimation Table

Design Ideas-> Requirements: Goals and Budgets	Idea 1 Impact Is <b>Designs</b> ± %	Idea 2 Impact ± %	Sum for Requirement (Sum of Percentage Impacts)	Sum of Percentage Uncertainty Values	Safety Deviation
<b>Performance Requirements</b> Reliability 300 <-> 3000 hours MTBF	1950hr (1650hr) =0	1140hr (840hr) ±240	92%	±9%	-108%
	61%±0	31%±9%			
	19min. (1min.) ±4	14min. (6 min.) ±9	70%	±130%	-130%
	10%±40%	60%±90%			
Maintenance 1.1M <-> 100K/year US\$	1.1M \$/Y (1.1 M \$/Y) ±180K	100K \$/Y (1 M \$/Y) ±720K	100%	±90%	-100%
	0%± 18%	100%±72%			
Sum of Performance	71%	191%			
<b>Resource Requirements</b> SS	500K (500K) ±200K	100K (100K) ±200K	60%	±40%	-10%
	50%±2	10%±2			
Sum of Costs	50%	10%			
Performance to Cost Ratio	1.42 (71/50)	19.10 (191/10)			

- Notes: 1. Time Period: Within next 12 months.  
 2. Same Safety Margin of factor 2 has been declared for performance requirements and resource requirements. Factor 2 means minimum planned performance requirements > 200% of target (goal), and maximum planned costs < 50% of target (budget).  
 3. Evidence, Source and Credibility not stated.

© Lindsey Brodie 2010

## 5. The Principle of the 'Seat Belt'

- "A safety margin
  - Is as necessary with uncertain estimates,
  - as a seat belt is with uncertain traffic.

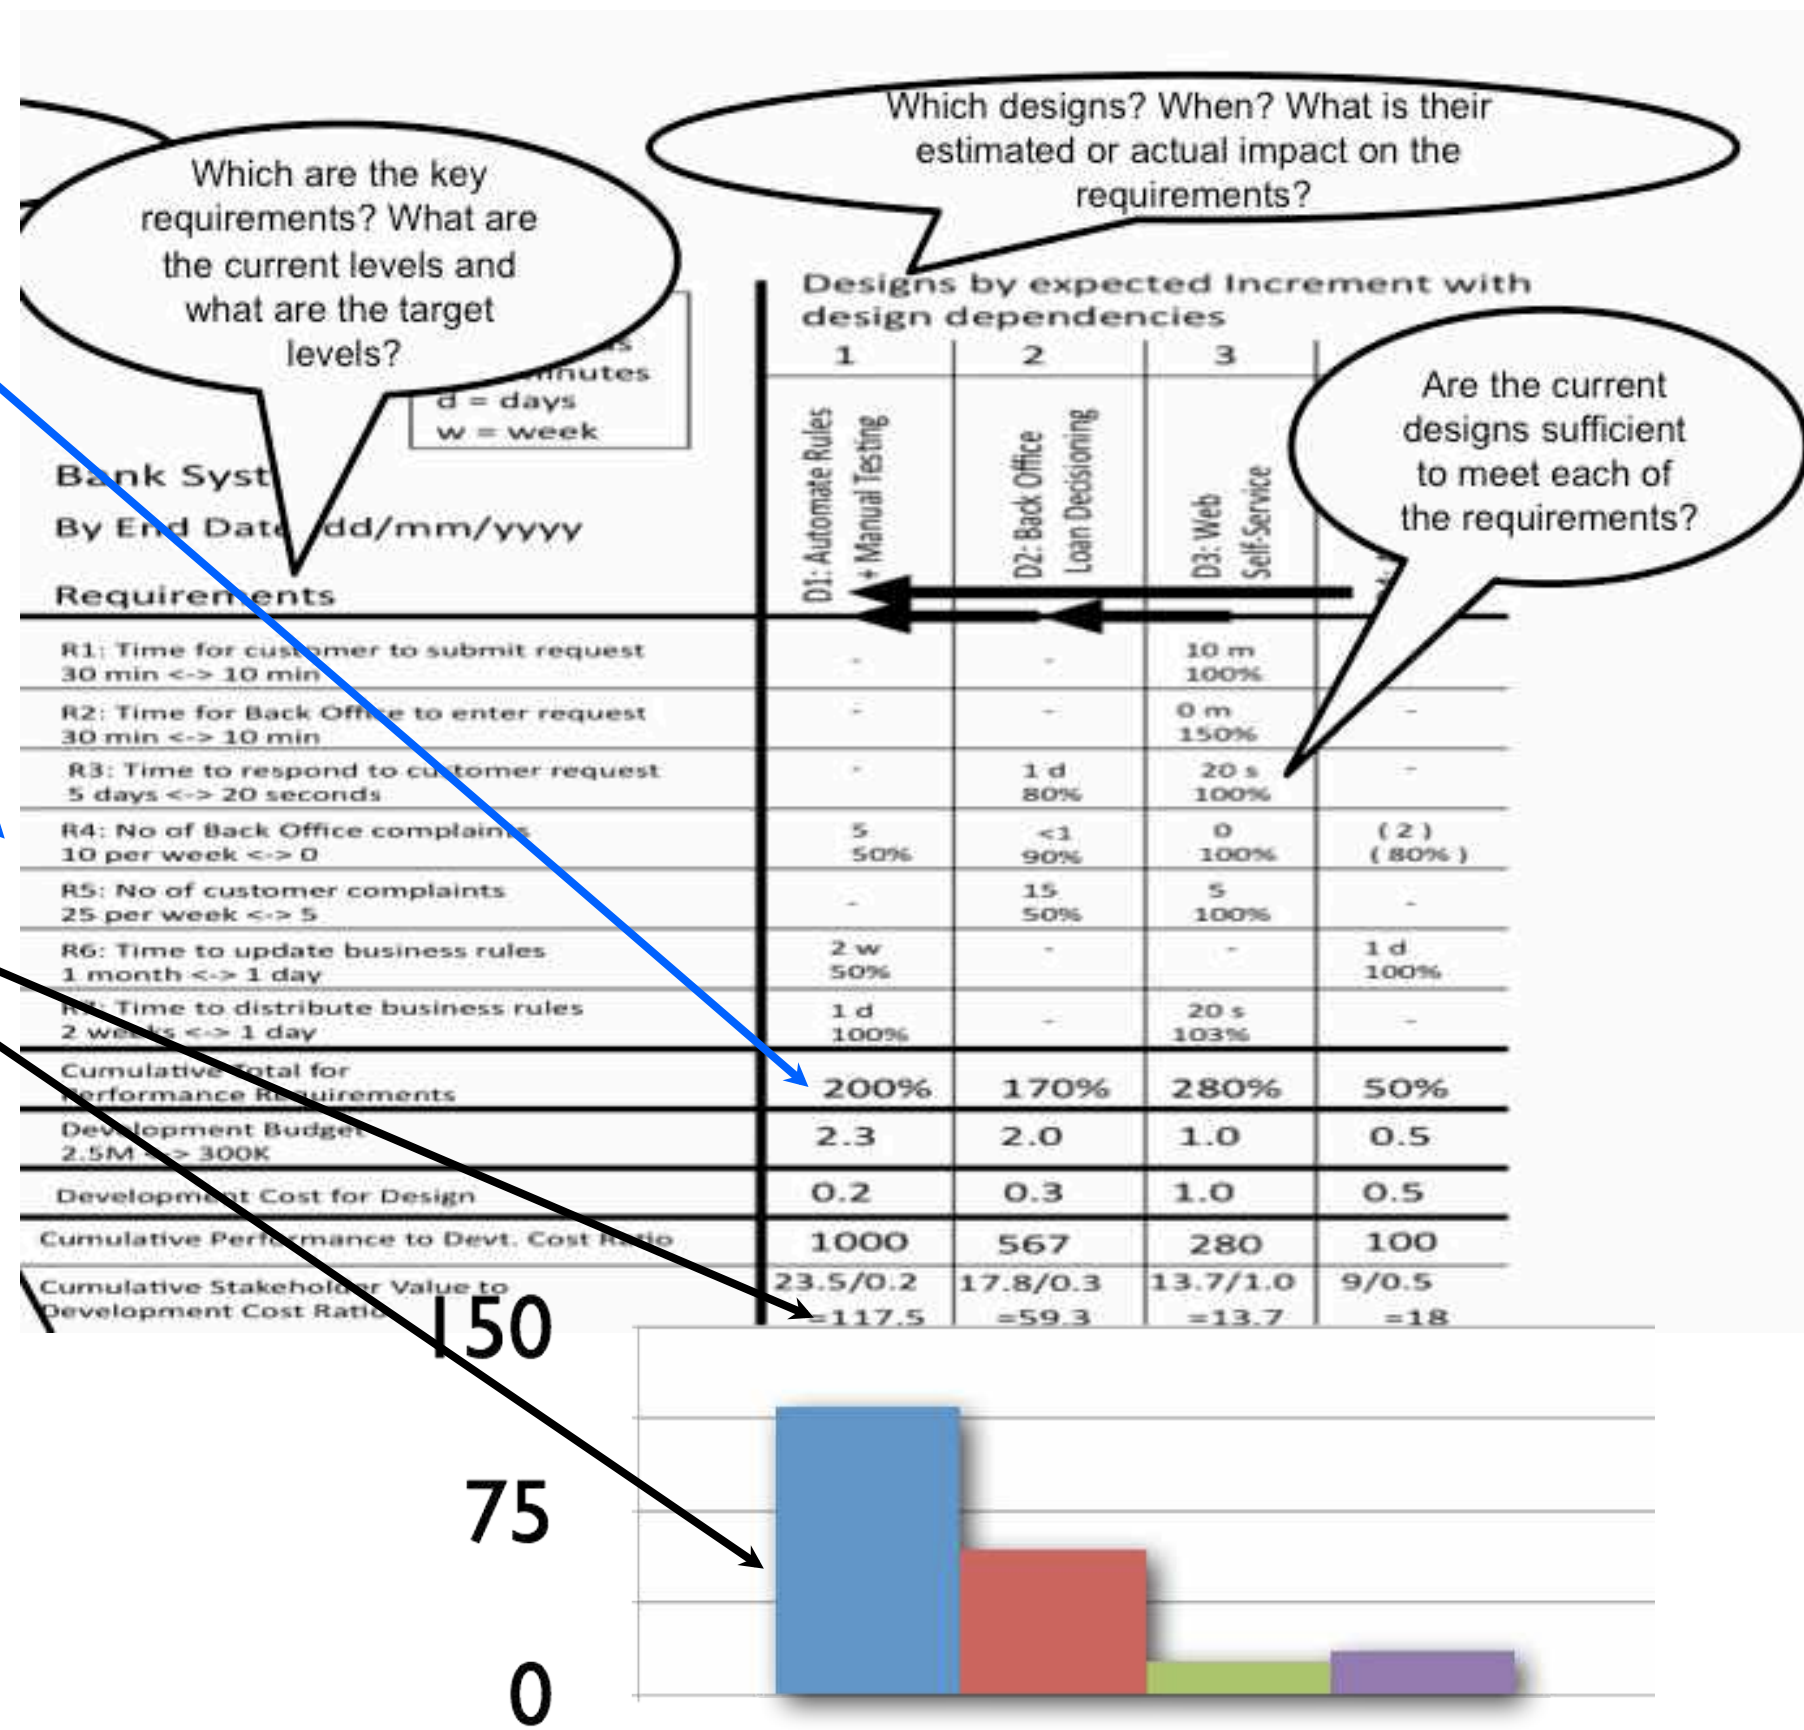

Key Values	Designs / Actions								Total Impact	Safety Factor
	Detailed risk assessment with associated impact estimation table for methods of mitigation	Research trip to madagascar (x3)	Detailed design research	Building financial models at community level	Research into existing sanitation projects	Creation of knowledge 'database'	Codification of our acquired knowledge	etc....		
	Impact (% progress towards target from given action)									
<b>Improve Sanitation</b> Target: 25% - 75% Unit: Waste collected / waste produced by user group	10	20	40	18	15	0	0		103	1.03
<b>Sustainability and Longevity</b> Target: 0\$ - 0\$ Unit: Cost to single user per month	0	5	20	50	10	0	0		85	0.85

Slide 167

- "10. The Efficiency Principle

- "When real life has

- "many stakeholder values,
- "and many cost constraints,
- "then
- "evaluation of designs (strategies)
- "must be done
- "with respect to both the values and the costs.

Team	Home points during 09/10 Premier League Season	Highest Season Ticket Price 10/11 Premier League Season	£/point

# Problem Statement

- "The greatest challenge to any thinker is stating the problem in a way that will allow a solution."
- 'Bertrand Russell

# Everything is vague

- *"Everything is vague to a degree you do not realize till you have tried to make it precise".*
- Bertrand Russell
